

Exercise 6-1

Module basics

Write a program, which

1. Has its own module
2. Has package `main` and a package `simple`
3. The main function uses a function from package `simple`
4. This function just prints "Do"

- 1 Create an empty root/work directory
- 2 Init module
- 3 Create an exported function with `package simple`
- 4 Create main.go in a subdirectory `/main` (or `/cmd`)
- 5 Import `simple` and call `Do`
- 6 Run main with full path
- 7 Output of the called funtion
